ReactJS - Practice Problem
Music Player Application

Practice Problem Details:
      Demo App URL: https://reactmusicplayer-ab9e4.firebaseapp.com/

Application Details:
- You can design the UI yourself. You DO NOT have to create an exact replica.
- All the UI components should be present which are:

- Left Side:
  - Track Cover Image
  - Progress Bar
  - Playback Buttons: shuffle, previous track, play/pause, next track, repeat the current track.
  - Track Title
  - Artist Name
- Right Side:
  - Playlist
  - Each card should have: track cover image, track title, artist name.

Functionalities:

- On load an API call should be sent to the backend to fetch playlist. (API Endpoint: http://5dd1894f15bbc2001448d28e.mockapi.io/playlist)
- On playlist item click the player should get updated with the selected track.
- On progress bar click, the progress should get updated like a seekbar.
- The next track should be played when the track is finished playing.
- On next track click, the next track from the playlist should be played if shuffle/repeat current is not selected.
- On previous track click, the previous track should be played.
- On shuffle click, track shuffle should be enabled which means when the next track button is clicked it should play a random track from playlist.
- On current repeat track click, the track should be repeated when the track is finished playing.
